10 advantages of technology: Technological Innovation in Legacy Sectors William B. Bonvillian, Charles Weiss, 2015-08-18 The American economy faces two deep problems: expanding innovation and raising the rate of quality job creation. Both have roots in a neglected problem: the resistance of Legacy economic sectors to innovation. While the U.S. has focused its policies on breakthrough innovations to create new economic frontiers like information technology and biotechnology, most of its economy is locked into Legacy sectors defended by technological/ economic/ political/ social paradigms that block competition from disruptive innovations that could challenge their models. Americans like to build technology covered wagons and take them out west to open new innovation frontiers; we don't head our wagons back east to bring innovation to our Legacy sectors. By failing to do so, the economy misses a major opportunity for innovation, which is the bedrock of U.S. competitiveness and its standard of living. Technological Innovation in Legacy Sectors uses a new, unifying conceptual framework to identify the shared features underlying structural obstacles to innovation in major Legacy sectors: energy, air and auto transport, the electric power grid, buildings, manufacturing, agriculture, health care delivery and higher education, and develops approaches to understand and transform them. It finds both strengths and obstacles to innovation in the national innovation environments - a new concept that combines the innovation system and the broader innovation context - for a group of Asian and European economies. Manufacturing is a major Legacy sector that presents a particular challenge because it is a critical stage in the innovation process. By increasingly offshoring production, the U.S. is losing important parts of its innovation capacity. Innovate here, produce here, where the U.S. took all the gains of its strong innovation system at every stage, is being replaced by innovate here, produce there, which threatens to lead to produce there, innovate there. To bring innovation to Legacy sectors, authors William Bonvillian and Charles Weiss recommend that policymakers focus on all stages of innovation from research through implementation. They should fill institutional gaps in the innovation system and take measures to address structural obstacles to needed disruptive innovations. In the specific case of advanced manufacturing, the production ecosystem can be recreated to reverse jobless innovation and add manufacturing-led innovation to the U.S.'s still-strong, research-oriented innovation system.

10 advantages of technology: Outsourcing: The Competitive Advantages Ade Asefeso MCIPS MBA, 2011-02-25 There are a number of core strategic questions which firms need to answer when entering into an outsourcing arrangement. The most significant is to what extent a firm should be prepared to outsource areas of potential competitive advantage. If one takes the view that

outsourcing is driven by a desire to reduce costs, by buying into a consistent set of scalable processes which are shared across a number of organisations, then it follows that none of these areas should (or could) be sources of unique competitive advantage.

10 advantages of technology: *Automated Management of Construction Projects* Javad Majrouhi Sardroud, 2011-07 Construction projects are extremely complex and often take place in an

uncontrolled and dynamic environment where each project goes through several phases leading to completion. In addition, projects in this industry suffer from quality problems, cost over-runs, and delays, which can be traced back to the lack of accurate and real-time information amongst the players. Because of this, modern construction management requires real-time and accurate information for sharing amongst all the parties involved, to undertake efficient and effective planning as well as execution of the projects. This book provides a new approach for automating the task of resources management in construction, integrating the latest innovations in ADC technologies (i.e. RFID, GPS, and GPRS). The proposed integrated system can facilitate extremely low-cost and infrastructure-free solutions to uniquely identify materials, components, and equipment and to track them in three phases, namely; production sites (off-site), shipping (en-route), and construction job sites (on-site) almost instantaneously. This book should assist contractors in automating the management of construction activities.
