This unauthorized biography goes behind the iconic myth of Sinatra to expose the well-hidden side of one of the most celebrated—and elusive—public figures of our time. Celebrated journalist Kitty Kelley spent three years researching government documents (Mafia-related material, wiretaps, and secret testimony) and interviewing more than 800 people in Sinatra's life (family, colleagues, law-enforcement officers, friends). The result is a stunning, often shocking exposé of a man as tortured as he was talented, as driven to self-destruction as he was to success. Featuring a new afterword by the author, this fully documented, highly detailed biography—filled with revealing anecdotes—is the penetrating story of the explosively controversial and undeniably multitalented legend who ruled the entertainment industry for fifty years and continues to fascinate to this day. Praise for *His Way* “The most eye-opening celebrity biography of our time.”—The New York Times “A compelling page-turner . . . Kitty Kelley's book has made all future Sinatra biographies virtually redundant.”—Los Angeles Herald Examiner

With the publication of this document, individual roadmaps and master plans for UASs, UGVs, and UMSs (defined as Unmanned Undersea Vehicles (UUVs) and Unmanned Surface Vehicles (USVs)) have been incorporated into a comprehensive DoD Unmanned Systems Roadmap. This integrated Unmanned Systems Roadmap is the plan for future prioritization and funding of these systems development and technology, thus ensuring an effective return on the Department's investment. Its overarching goal, in accordance with the Strategic Planning Guidance (SPG), is to guide military departments and defense agencies toward logically and systematically migrating applicable mission capabilities to this new class of military tools. This Roadmap highlights the most urgent mission needs that are supported both technologically and operationally by various unmanned systems. These needs, listed below, should be considered when prioritizing future research, development, and procurement of unmanned systems technology to ensure an effective return on the Department's investment.

Nanotechnology Jürgen Altmann, 2007-05-07 With revolutionary changes in nanotechnology (NT) now on the horizon, many countries have started major research and development (R&D) programmes, which are mainly civilian. Often overlooked are military R&D programmes – in particular those of the US government. This is the first systematic and comprehensive presentation of the potential military applications of NT. In ten to twenty years, these applications may include extremely small computers, robots, missiles, satellites, launchers and sensors. They may also provide lighter and stronger materials for vehicles and weapons, implants in soldiers' bodies, metal-free firearms, autonomous fighting systems, and smaller chemical and biological weapons. These potential uses raise strong concerns. This assessment is made from a viewpoint of international security, considering the new criteria of dangers for arms control and the international law of warfare, dangers for stability through potential new arms races and proliferation, and dangers for humans and society. Some military applications, such as computers, will be so close to civilian uses that limits are impractical. Others, such as sensors for biological-warfare agents, may contribute to stronger protection against terrorist attacks and better verification of compliance with arms-control treaties. For preventive limitation of these new technologies, specific approaches are proposed that balance positive civilian uses and take into account verification of compliance, with a view to international peace and security, not national military strength. This book will be of great interest to scholars of military technology, non-lethal weapons, disarmament and security studies in general.
