10110 technology blvd dallas tx 75220: International Opportunities in the Arts Mary Sherman, 2019-09-03 This book is a compilation of papers derived from talks, presented at TransCultural Exchange's 2018 International Conference on Opportunities in the Arts. The aim of these talks was to inspire artists to think across disciplines and cultures and to suggest other career models beyond the typical studio to gallery/museum model. Much of this content is unique in that it not only addresses the practical needs of artists but, even more importantly, it does so in the context of today's global reality. As artists have noted on post-Conference surveys, this information is "the missing link in the art world; the bridge between academic and real-world practice; between a local and international career in the arts." By making this information available long-after the Conference's end and to those who could not directly participate in the Conference, many more artists will have access to where to find jobs/residency programs and funding for their work, information on how to put together successful residency applications, how to market their work, and other professional development programming. In addition, they (and interested members of the public) will have access to the Conference talks on what leading artists are doing across disciplines, with new technologies, and in the public sphere.

10110 technology blvd dallas tx 75220: Ethics in Design and Communication Laura Scherling, Andrew DeRosa, 2020-02-20 This timely collection brings together critical, analytic, historical, and practical studies to address what ethics means in the practice of design. Designers face the same challenges as everyone else in the complex conditions of contemporary cultural life-choices about consumption, waste, exploitation, ecological damage, and political problems built into the supply chains on which the global systems of inequity currently balance precariously. But designers face the additional dilemma that their paid work is often entangled with promoting the same systems such critical approaches seek to redress: how to reconcile this contradiction, among others, in seeking to chart an ethical course of action while still functioning effectively in the world. Ethics in Design and Communication acknowledges the complexity of this subject matter, while also demonstrating that in the ongoing struggle towards an equitable and sustainable world, the talents of design and critical thought are essential. Featured case studies include graphic design internships today, the dark web, and media coverage of the 2016 US presidential election. The fact that within this book such a wide array of practitioners, scholars, critics, and professionals commit to addressing current injustices is already a positive sign. Nonetheless, it is essential that we guard against confusing the coercive force of moral imperatives with ethical deliberation when conceiving a foundation for action.

10110 technology blvd dallas tx 75220: *Numerical Investigation of Aerodynamics of Canard-Controlled Missile Using Planar and Grid Tail Fins. Part 1. Supersonic Flow* James DeSpirito, Milton E. Vaughn, Jr., W. D. Washington, 2002-09 Viscous computational fluid dynamic simulations were used to predict the aerodynamic coefficients and flowfield around a generic canard-controlled missile configuration in supersonic flow. Computations were performed for Mach 1.5 and 3.0, at six angles of attack between 0 and 10, with 0 and 10 canard deflection, and with planar and grid tail fins, for a total of 48 cases. Validation of the computed results was demonstrated by the very good agreement between the computed aerodynamic coefficients and those obtained from wind tunnel measurements. Visualizations of the flowfield showed that the canard trailing vortices and downwash produced a low-pressure region on the starboard side of the missile that in turn produced an adverse side force. The pressure differential on the leeward fin produced by the interaction with the canard trailing vortices is primarily responsible for the adverse roll effect observed when planar fins are used. Grid tail fins improved the roll effectiveness of the canards at low supersonic speed. No adverse rolling moment was observed with no canard deflection, or at the higher supersonic speed for either tail fin type due to the lower intensity of the canard trailing vortices in these cases. Flow visualizations from the simulations performed in this study help in the understanding of the flow physics and can lead to improved canard and tail fin designs for missiles and rockets.
