Abstract: This comprehensive guide explores the complexities of 3rd party patch management within Microsoft Intune, offering insights into its capabilities, limitations, and best practices. We delve into various strategies, including leveraging native Intune features, integrating with third-party solutions, and addressing the unique challenges associated with managing patches for non-Microsoft applications. This guide is designed to equip IT professionals with the knowledge needed to effectively implement a robust 3rd party patch management strategy within their Intune environment.

Introduction: Effectively managing patches is critical for maintaining a secure IT environment. While Microsoft Intune excels at patching Microsoft applications and operating systems, the challenge lies in managing patches for 3rd party applications. This article provides a deep dive into 3rd party patch management in Intune, examining different approaches and considering the strategic considerations involved.

Understanding the Challenges of 3rd Party Patch Management in Intune:

Intune's native capabilities are primarily focused on Microsoft products. Therefore, securing and updating 3rd party applications requires a more multifaceted approach. Key challenges include:

Vendor Dependency: Reliance on individual vendors for patch updates and compatibility.

Patch Compatibility: Ensuring patches don't conflict with other software or cause system instability.

Deployment Complexity: Managing the distribution and installation of patches across diverse device fleets.

Automated Patching Limitations: The inherent limitations of Intune's automation capabilities when handling 3rd party applications.

Security Vulnerability Management: Identifying and prioritizing vulnerabilities in 3rd party software.

Strategies for 3rd Party Patch Management in Intune:

Several strategies can be employed to address the challenges of 3rd party patch management in Intune:

1. Leveraging Intune's Built-in Capabilities (Where Possible):

While limited, Intune can manage some 3rd party applications if those vendors integrate with Intune's app protection policies or provide their own management tools that can be integrated. This usually requires a well-defined app management strategy.

1. Integrating with Third-Party Patch Management Solutions:

Many third-party solutions integrate with Intune, extending its capabilities for 3rd party patching. These solutions often offer:

Automated Patch Discovery: Identifying vulnerable 3rd party applications.

Centralized Patch Management: Managing patch deployment across the entire device fleet.

Patch Remediation: Automating the process of deploying and installing patches.

Reporting and Analytics: Providing visibility into patch deployment status and vulnerabilities.

Selecting a suitable third-party solution depends on several factors, including the size and complexity of the environment, budget considerations, and compatibility with existing infrastructure.

1. Manual Patch Management (Least Recommended):

Manual patch management is generally discouraged for large-scale deployments. It's highly prone to errors and inefficiencies. However, in certain limited circumstances involving very specific applications or devices, it might be necessary.

1. Developing a Robust Patch Management Policy:

A comprehensive policy should cover:

Vulnerability Assessment: Regularly assessing the security posture of 3rd party applications.

Patch Prioritization: Categorizing patches based on severity and risk.

Testing: Thoroughly testing patches in a controlled environment before deploying to production.

Rollout Strategy: Implementing a phased rollout to minimize disruption.

Monitoring and Reporting: Continuously monitoring the effectiveness of the patching strategy.

Best Practices for 3rd Party Patch Management in Intune:

Inventory Management: Maintain a comprehensive inventory of all 3rd party applications deployed in the environment.

Regular Vulnerability Scanning: Conduct regular vulnerability scans to identify potential security risks.

Software Updates: Enable automatic updates whenever possible for 3rd party applications.

Strict Patching Schedules: Establish regular patching schedules to minimize the window of vulnerability.

Proper Communication: Communicate effectively with users about scheduled patching activities.

Documentation: Document the entire process, including the chosen strategy, tools, and policies.

Choosing the Right Third-Party Patch Management Solution:

Key factors to consider when evaluating 3rd party solutions include:

Compatibility with Intune: Ensure seamless integration with Intune.

Support for Your Applications: Verify support for the specific 3rd party applications in use.

Scalability: Choose a solution that can scale to meet the needs of your growing environment.

Ease of Use: Select a user-friendly solution that simplifies the management process.

Cost: Consider the total cost of ownership, including licensing fees and support.

Conclusion:

Effective 3rd party patch management in Intune is crucial for maintaining a secure IT environment. While Intune provides a solid foundation, leveraging third-party solutions and establishing a comprehensive patch management policy are essential for addressing the complexities of managing patches for non-Microsoft applications. By implementing the strategies and best practices outlined in this guide, organizations can significantly reduce their vulnerability to cyber threats and ensure the ongoing security of their systems.

With Windows 10, organizations can create a consistent set of configurations across the modern enterprise desktop—for PCs, tablets, and phones—through the common Mobile Device Management (MDM) layer. MDM gives organizations a way to configure settings that achieve their administrative intent without exposing every possible setting. One benefit of MDM is that it enables organizations to apply broader privacy, security, and application management settings through lighter and more efficient tools. MDM also allows organizations to target Internet-connected devices to manage policies without using Group Policy (GP) that requires on-premises domain-joined devices. This makes MDM the best choice for devices that are constantly on the go. With Microsoft making this shift to using Mobile Device Management (MDM), a cloud-based policy-management system, IT professionals need to know how to do similar tasks they do with Group Policy, but now using MDM, with its differences and pitfalls.

3rd party patch management intune: *Albion's Seed* David Hackett Fischer, 1991-03-14 This fascinating book is the first volume in a projected cultural history of the United States, from the earliest English settlements to our own time. It is a history of American folkways as they have changed through time, and it argues a thesis about the importance for the United States of having been British in its cultural origins. While most people in the United States today have no British ancestors, they have assimilated regional cultures which were created by British colonists, even while preserving ethnic identities at the same time. In this sense, nearly all Americans are Albion's Seed, no matter what their ethnicity may be. The concluding section of this remarkable book explores the ways that regional cultures have continued to dominate national politics from 1789 to 1988, and still help to shape attitudes toward education, government, gender, and violence, on which differences between American regions are greater than between European nations.

3rd party patch management intune: Brand New Justice Simon Anholt, 2006-08-11 Recently vilified as the prime dynamic driving home the breach between poor and rich nations, here the branding process is rehabilitated as a potential saviour of the economically underprivileged. *Brand New Justice*, now in a revised paperback edition, systematically analyses the success stories of the Top Thirteen nations, demonstrating that their wealth is based on the 'last mile' of the commercial process: buying raw materials and manufacturing cheaply in third world countries, these countries realise their lucrative profits by adding value through finishing, packaging and marketing and then selling the branded product on to the end-user at a hugely inflated price. The use of sophisticated global media techniques alongside a range of creative marketing activities are the lynchpins of this process. Applying his observations on economic history and the development and impact of global marketing, Anholt presents a cogent plan for developing nations to benefit from globalization. So long the helpless victim of capitalist trading systems, he shows that they can cross the divide and graduate from supplier nation to producer nation. Branding native produce on a global scale, making a commercial virtue out of perceived authenticity and otherness and fully capitalising on the 'last mile' benefits are key to this graduation and fundamental to forging a new global economic balance. Anholt argues with a forceful logic, but also backs his hypothesis with enticing glimpses of this process actually beginning to take place. Examining activities in India, Thailand, Russia and Africa among others, he shows the risks, challenges and pressures inherent in 'turning the tide', but above all he demonstrates the very real possibility of enlightened capitalism working as a force for good in global terms.
