4005 technology drive angleton tx 77515: Environmental Forensics R E Hester, R M Harrison, 2008-06-27 'Environmental forensics' is a combination of analytical and environmental chemistry, which is useful in the court room context. It therefore involves field analytical studies and both data interpretation and modelling connected with the attribution of pollution events to their causes. Recent decades have seen a burgeoning of legislation designed to protect the environment and, as the costs of environmental damage and clean-up are considerable, not only are there prosecutions by regulatory agencies, but the courts are also used as a means of adjudication of civil damage claims relating to environmental causes or environmental degradation. As a result is the increasing number of prosecutions of companies who have breached regulations for environmental protection and in civil claims relating to harm caused by excessive pollutant releases to the environment. Such cases can become extremely protracted as expert witnesses provide their sometimes conflicting interpretations of environmental measurement data and their meaning. It is in this context that environmental forensics is developing as a specialism, leading to greater formalisation of investigative methods which should lead to more definitive findings and less scope for experts to disagree. Now a significant subject in its own right, at least one journal devoted to the field and a number of degree courses have sprung up. As a result of the topicality and rapid growth of the subject area, is the publication of this book - the 26th volume in the highly acclaimed Issues in Environmental Science and Technology Series. This volume contains authoritative articles by a number of the leading practitioners across the globe in the environmental forensics field and aims to cover some of the main techniques and areas to which environmental forensics are being applied. The content is comprehensive and describes a number of the key areas within environmental forensics - topics covered by the authors include: - Source identification issues - Microbial techniques - Metal contamination and methods of assigning liability - The use of isotopes to determine sources and their applications - Molecular biological methods - Hydrocarbon

fingerprinting techniques - Oil chemistry and key compound identification - The emerging role of environmental forensics in groundwater pollution Additionally, the volume considers specific pollutants and long-lived pollutants of groundwater such as halocarbons which have presented particular problems and which are described in some depth, as well as the way in which chemical degradation processes can lead to compositional changes which provide valuable information. The book provides a comprehensive overview of many of the key areas of environmental forensics written by some of the leading experts in the field. It will be both of specialist use to those seeking expert insights into the field and its capabilities as well as of more general interest to those involved in both environmental analytical science and environmental law.

4005 technology drive angleton tx 77515: Shakespeare Identified J. Thomas Looney, 2019-02-07 In 1920 J. Thomas Looney's Shakespeare Identified introduced the idea that Edward de Vere, 17th Earl of Oxford, was the man behind the pseudonym William Shakespeare. This Centenary Edition-with the first new layout since the 1920 U.S. edition-is designed to enhance readers' enjoyment as they make their way through Looney's fascinating account of how he, shining light from a new perspective on facts already known to Shakespeare scholars of his day, uncovered the true story of who Shakespeare actually was and how he came to write his works. Even as the centenary of its publication approaches, Shakespeare Identified remains the most revolutionary book on Shakespeare ever written. Since its appearance several generations of scholars have deepened and extended Looney's original findings, further substantiating his claim that Edward de Vere was indeed the author of the dramatic and poetic works widely regarded as the greatest in the English language. Perhaps most importantly for scholars, this edition of Looney's classic text identifies the sources of more than 230 passages he quoted from other works, providing readers for the first time with accurate information on the books and papers he consulted in his research. A Bibliography at the end of the book supplements those notes for easy reference to Looney's sources. So if you're new to the Shakespeare authorship question, or even if you've read widely on the subject, get set to enjoy the book that novelist John Galsworthy called the best detective story he had ever read.

They are visceral, raw, lived documents of someone who has always had to fight for everything he's achieved, most often, and most tellingly, with himself. Shepherd, Agnes Kruchio, 2008 International space science began suddenly with the creation of COSPAR (Committee on Space Research) in October, 1958, and its first plenary meeting was held in London, in November the same year. Canada was at the table for both the creation and the first plenary meeting. This book describes the parallel growth of the Canadian space science program from that date up to the 50th Anniversary of COSPAR, to be celebrated in Montreal in July 2008. This work relates the history of ground-based activity that placed Canada at the forefront of nations with knowledge of space in 1958, gained primarily through observations of the aurora borealis by optical and radar methods. By the time of the International Geophysical Year, 1957-58, Canada was well established in this research and had built its own rocket payloads. During the sixties this activity increased tenfold with the inception of the Alouette/ISIS satellite missions in 1962, and a vigorous rocket program conducted at Fort Churchill and elsewhere. After the last Defence Research Board satellite, ISIS-11, was launched in 1971 the program changed direction; the National Research Council maintained the rocket program at a lower level and space opened up for Canadian instruments on international spacecraft leading to some highly successful missions. Long overdue, the Canadian Space Agency was established in 1989 and is now leading a more mature program including Canada's first scientific mission since ISIS-11 (SCISAT-1), the Earth-observing Radarsat-1 and a strong astronaut program. The final achievement of the fifty years is a Canadian-built lidar that is part of the NASA Phoenix mission and is on its way to Mars, destined to land there in May 2008.

4005 technology drive angleton tx 77515: The Spirit of 'seventy-six Henry Steele Commager, Richard Brandon Morris, 1958 Who shall write the history of the American Revolution? Who can write it? asked John Adams in 1815. Renowned scholars Henry Steele Commager and Richard B. Morris have provided a prudent, perceptive answer--the participants themselves--and in the process have fashioned from the vast source material a thrilling chronological narrative. The Spirit of 'Seventy-Six allows readers to experience events long-entombed in textbooks as they unfold for the first time for both Loyalists and Patriots: the Boston Tea Party, Bunker Hill, the Declaration of Independence, and more. In letters, journals, diaries, official documents, and personal recollections, the timeless figures of the Revolution emerge in all their human splendor and folly to stand beside

the nameless soldiers. Profusely illustrated and enhanced by cogent commentary, this book examines every aspect of the war, including the Loyalist and British views; treason and prison escapes; songs and ballads; the home front and diplomacy abroad. In short, the editors have wrought a balanced, sweeping, and compelling documentary history.
