acc business att: Methods in Protein Sequence Analysis Marshall Elzinga, 2012-12-06 *Methods in Protein Sequence Analysis* contains an intensely practical account of all the new methodology available to scientists carrying out protein and peptide sequencing studies. Many of the striking advances in fields as diverse as immunology, cell motility, and neurochemistry have in fact been fueled by our ever more powerful ability to determine the sequences and structures of key proteins and peptides. It is our hope that the rich array of techniques and methods for sequencing proteins discussed in this volume—methods that generate much of the information crucial to progress in modern biology—will now become accessible to all who can benefit from them. The papers of the present volume constitute the Proceedings of the IVth International Conference on Methods in Protein Sequence Analysis, which was held at Brookhaven National Laboratory, Upton, NY, September 21-25, 1981. It was the most recent in a series of biennial conferences, the previous one having been held in Heidelberg, GFR, in 1979. The series was originated by Richard Laursen, and initially dealt with one aspect of the field, solid-phase sequencing. The scope of the meeting was very broad and among the many aspects of protein sequencing discussed were: instrumentation, strategy, chemicals, mass spectrometry, cleavage of proteins and separation of peptides, and solid, liquid, manual, and even gas phase sequencing.

acc business att: *Genetic Engineering of Microorganisms for Chemicals* Alexander Hollaender, 2013-04-09 The normal course of most biologically catalyzed processes is tightly regulated at the genetic and physiological levels. The regulatory mechanisms are diverse, sometimes redundant, and it is becoming increasingly apparent that, at the genetic level, the range of mechanisms may be limited only by the permutations and combinations available. For each microbial cell, evolution appears to have resulted in maximized advantage to that cell, achieving regulatory balance. Genetic engineering encompasses our attempts to perturb the genetic regulation of a cell so that we may obtain desired other than normal outcomes, such as increased product formation, or new product formation. Following the groundwork established by a preceding symposium (*Trends in the Biology of Fermentations for Fuels and Chemicals*, Brookhaven National Laboratory, December 1980), the initial planning for this conference envisioned the juxtaposition of molecular genetic expertise and microbial biochemical expertise. The resultant interaction should encourage new and extended ideas for the improvement of strains and for the generation of new regulatory combinations to enhance

microbial chemical production from cheap and abundant (including waste) substrates. The interaction should also demonstrate that new discoveries at the basic level remain essential to progress in genetic engineering. New genetic regulatory combinations require new studies of physiology and biochemistry to assure understanding and control of the system. New biochemical reactions necessitate new studies of genetic and regulatory interaction.

acc business att: RNA Tumor Viruses, Oncogenes, Human Cancer and AIDS: On the Frontiers of Understanding Philip Furmanski, Jean Carol Hager, Marvin A. Rich, 2012-12-06 We stand today on the threshold of a new understanding of cancer. Primarily through the powerful tools of molecular biology, unified hypotheses explaining the origins of the disease are emerging and rapidly being validated. This volume, which presents the latest findings from laboratories throughout the world on the role of RNA tumor viruses in cancer, is a celebration of these achievements and a prediction of further progress leading ultimately to the control of the disease. It is important in this context to recall the natural history or life cycle of RNA cancer virology. From the earliest days of the science, when viruses were first recognized as distinct biologic agents of etiologic significance, their role in cancer was proposed and hotly debated. The critical early discoveries, even those made as recently as 25 years ago, were met with rejection; not skepticism or cautious restraint, but outright rejection. During the 60's, there was a gradual acceptance of the association between viruses and cancer, the result of landmark studies in experimental systems, and this led to a frenzy of activity in the field. There followed another period of doubt and uncertainty, due to the difficulty in attempting to apply directly, and in retrospect inappropriately, the tenets of infectious disease to human cancers, only to have the field resurrected, revitalized and redirected by the explosion of progress in molecular biology and genetics.

Among the highlights are methods to use immunoglobulin gene rearrangements as markers of clonality, to exploit patterns of somatic mutation in the variable regions to indicate at which stage transformation occurred, and to apply gene arrays to the question of biological heterogeneity in morphologically similar diseases. Research methodologies that are highly likely to become routine practice in the future, such as DNA microarray and immunoglobulin V-gene rearrangements, and measurement of minimal disease, are included. There are also molecular techniques for providing for producing novel therapeutics, such as a DNA vaccine with patient-specific sequences derived from the lymphoma in question.

Bond, 2012-12-06 The Tenth International Conference on Intracellular Protein Catabolism was held in Tokyo Japan, October 30-November 3, 1994. under the auspices of the International Committee on Proteolysis (ICOP). ICOP meetings have been held biennially in the USA, Europe, and Japan in turn. The previous three ICOP meetings (7th to 9th) were held in Shimoda, Japan, in 1988. in Wildbad Kreuth, Germany, in 1990, and in Williamsburg, Virginia, in 1992. Previous meetings were held in resort areas, this was the first meeting held in a large city. Attendance has grown every year so that nearly 400 participants from 19 different countries attended the Tokyo meeting. At the meeting, novel and updated results on the structure-function, physiology, biology, and pathology of proteases and inhibitors were discussed, together with cellular aspects of proteolysis and protein turnover. Thirty-nine invited papers and eight selected posters were presented orally and 171 poster presentations were discussed. This book documents almost all of the lectures and some selected posters. Since the world of proteolysis and protein turnover is expanding very rapidly, far beyond our expectations, it is impossible to cover all the new aspects of this field. However, this book will give an idea of the current status, trends, and directions of the field, and information necessary to understand what is and will be important in this field. Further, the editors hope that the novel ideas, approaches, methodologies, and important findings described in this book will stimulate further study on proteolysis and protein turnover.

Sharma, 2013-03-09 This volume contains the proceedings of an International Symposium on 'Second Messenger Systems - Molecular, Cellular and Behavioural Aspects', which was held at Tobago on June 16-17, 1994. The interaction of an extracellular agonist (First Messenger) with its plasma membrane receptor leads to the transmission of a signal across the cell membrane and results in the production and/or activation of other signalling molecules (Second Messengers). These Second Messengers control the action of many protein kinases and protein phosphatases and so lead to cellular responses. Although the biochemical basis of the transduction of signals in the main signalling systems in eukaryotic cells is probably largely known, intensified research is ongoing in the following areas: the discovery of specific substrates for many protein kinases, elucidation of the biological significance of the differential tissue expression and heterogeneity of many signalling proteins, and the unravelling of diverse interactions (such as signal potentiation, synergism, antagonism and neuronal co-transmission) between signalling systems. As knowledge from such studies accumulates, it is becoming clear that the 'cross talk' interactions between signalling systems are important features of dynamic cell regulation. This volume is designed to summarize some aspects of the current work on various Second Messenger Systems and the integration of signals with respect to plasma membrane receptors. Second Messenger generation and degradation, protein kinase and phosphatase, cell cycle control, and cellular learning and memory.

Glutamate -the subject we chose for the first meeting of this series - is an excellent example since it has a major role in many physiological or pathological situations. This book contains the proceedings of the meeting which was held in Paris on September 24, 1990. As for the proceedings of the meeting on Alzheimer's disease - published in the series Research and Perspectives in Alzheimer's disease -these meetings will be reported in a new series, distributed at an international level, Research and Perspectives in Neurosciences. EHRLICH, 1909 Exciting events in the basic disciplines of virology, immunology, and pharmacology continue to advance the understanding of the pathogenesis and control of virus diseases. At the same time, the rational development of antiviral agents is attracting, to an increasing extent, the interest of workers in other disciplines. Improvements in technology facilitate the definition of potential target sites for antiviral intervention and unmask new viral and host genes. The outcome is a further steady development of new antiviral agents which approach the magic bullets first proposed by PAUL EHRLICH. Remarkable advances in protein synthetic methods that yield polypeptides which inhibit active sites of viral proteins have aided substantially in the basic and clinical study of these antiviral agents. In addition, the extremely rapid progression in recombinant DNA techniques, leading to the synthesis of large quantities of gene products, is also increasing our opportunities at a dashing pace. New information and developing technology facilitate research on the mechanism of action, toxicity, pharmacokinetics, and pharmacodynamics of new agents. The list of clinically effective antiviral agents is expanding and the number of potentially useful compounds is growing rapidly. This book is a combined theoretical text and practical manual which, it is hoped, will be of use to all who have an interest in virus diseases, particularly scientists, physicians and graduate students.

acc business att: Rice Y. P. S. Bajaj, 2012-12-06 Rice is the most important cereal crop which feeds more than half the population of the world. It is being grown in more than 144. 641 million ha

with a production of over 468. 275 million tons (in 1988). Rice is attacked by a large number of pests and diseases which cause an enormous loss in its yield. Therefore, the major objectives in rice breeding are the development of disease resistance, tolerance to insects, adverse soil water, and drought; and improvement of quality including increased protein content. Tremendous efforts being made at the International Rice Research Institute have resulted in the release of improved varieties. It is estimated that the world's annual rice production must increase from 460 million tons (in 1987) to 560 million tons by the year 2000, and to 760 million tons by 2020 (a 65% increase) in order to keep up with the population growth (IRRI Rice Facts 1988). To achieve this gigantic goal, new strategies have to be evolved. Since the success of any crop improvement program depends on the extent of genetic variability in the base population, new techniques need to be developed not only to generate the much needed variability but also for its conservation. In this regard the progress made in the biotechnology of rice during the last 5 years has amply demonstrated the immense value of innovative approaches for further improvement of this crop.

Gupta, 2006-07-02 Recent developments of experimental techniques in cellular and molecular biology have made it possible to understand the molecular biology of male gametogenesis in greater detail. This book focuses on the description of specialized proteins, which are dominantly and/or specifically expressed in germ cells and localized in spermatozoa. There is an urgent need to classify proteins of spermatogenic cells with a view of their functions, and their applications in the regulation of fertility and in understanding infertility. The understanding of structural properties of male germ cell specific proteins can offer vulnerable points for targeted intervention in testis without generalized effects on stages of spermatogenesis. Besides targeted action in male germ cells, sperm specific proteins and polypeptides may also offer potential application in the development of a contraceptive vaccine.

This book, which uses human and animal viruses as models, aims to understand the developments in molecular virology during the last 20 years. Although molecular virology could also be taught by means of bacteriophages or plant viruses, the advantage of using animal viruses is in their ability to cause human and animal diseases as well as to transform cells, a primary problem in medicine. For the sake of clarity and convenience, not all the individual contributors to the various aspects of molecular virology were cited in the text. Instead, the reader is referred to review articles or key papers that list the numerous excellent publications that have contributed to clarification of the various molecular processes. Thus the end-of-chapter bibliographies will guide the reader to the publications in which the original contributing authors are quoted. References given under the heading Recommended Reading are intended to assist those interested in pursuing a given subject further. I hope that this book will fulfill the purpose for which it is designed, and I urge readers to contact me if errors are found or updating is required.

acc business att: Constituent Order in Classical Latin Prose Olga Spevak, 2010-03-24 Latin is a language with variable (so-called 'free') word order. Constituent Order in Classical Latin Prose (Caesar, Cicero, and Sallust) presents the first systematic description of its constituent order from a pragmatic point of view. Apart from general characteristics of Latin constituent order, it discusses the ordering of the verb and its arguments in declarative, interrogative, and imperative sentences, as well as the ordering within noun phrases. It shows that the relationship of a constituent with its surrounding context and the communicative intention of the writer are the most reliable predictors of the order of constituents in a sentence or noun phrase. It differs from recent studies of Latin word order in its scope, its theoretical approach, and its attention to contextual information. The book is intended both for Latinists and for linguists working in the fields of the Romance languages and

language typology.
