access physical therapy armonk: Non-pharmacological Interventions for Mental Disorders Lara Guedes De Pinho, César Fonseca, Manuel Lopes, Brooke Schneider, Łukasz Gawęda, 2024-04-01 One of the side effects of the COVID-19 pandemic was the worsening of the symptomatology of mental disorders. The number of people with mental disorders has increased and pre-existing mental disorders have worsened, in many cases. Psychopharmacology alone is not sufficient for the treatment of conditions such as schizophrenia, depression, bipolar disorder, and generalized anxiety disorder, among others, and the combined use of psychopharmacology and non-pharmacological interventions is recommended by international guidelines. Despite this, most people around the world do not have access to non-pharmacological interventions and when they are diagnosed with a mental disorder, only psychopharmacological drugs are prescribed. In other cases, although non-pharmacological interventions, for example psychotherapy, are also prescribed, this response takes a long time.

access physical therapy armonk: Children with Developmental Coordination Disorder David Sugden, Mary Chambers, 2005-01-28 The term Developmental Coordination Disorder (DCD) is used to describe a group of children who have difficulty with tasks involving movement such that it interferes with their daily living or academic progress. As with other developmental disorders such as autistic spectrum disorder, attention deficit disorder and dyslexia, DCD is now a prominent concern of both researchers and practitioners. This text is aimed at both researchers and professionals who work in a practical manner with the condition and includes professionals in health, occupational therapists, physiotherapists, health visitors, paediatricians, and - in the educational field - teachers and others who are in daily contact with the children - their parents. The essence of the text is that work with children should be guided by research evidence driving the clinical practice which in turn raises more questions for research. The authors in this text have both experience in research and are engaged in the day-to-day clinical work with children and bring both of these to bear in the chapters they have written.

access physical therapy armonk: Fragility Fractures of the Pelvis Pol Maria Rommens, Alexander Hofmann, 2017-12-19 Thanks to an increasing life expectancy of our populations the number of elderly persons is steadily growing and will continue to do so. Among these, the rate of persons with illnesses and degenerative diseases is significant. The prevalence of osteoporosis is especially high in elderly women and leads to typical fracture patterns. Hip fractures, proximal humerus fractures, distal radius fractures and fractures of the vertebral column are the most common. In the last decade, we are confronted with a sharp increase of fragility fractures of the pelvis. Until now, there is no consensus on how to identify and classify these lesions and there are no guidelines for treatment and after treatment. In particular, there is no common view on which patients need an operative treatment and which technique of osteosynthesis should be used. This

book fills the gap in available literature and gives a state of the art guide to the treatment of fragility fractures of the pelvis. With the sharp increase of these fractures and the lacking consensus, Fragility Fractures of the Pelvis will become indispensable for the physicians who take care of elderly patients with this pathology. Written by a team of expert opinion leaders, the aim of this book is to contribute to the scientific discussion in this area and to help provide the optimal care for these patients.

access physical therapy armonk: WHO Global Report on Falls Prevention in Older Age World Health Organization, 2008 The WHO Falls Prevention for Active Ageing model provides an action plan for making progress in reducing the prevalence of falls in the older adult population. By building on the three pillars of falls prevention, the model proposes specific strategies for: 1. Building awareness of the importance of falls prevention and treatment; 2. Improving the assessment of individual, environmental, and societal factors that increase the likelihood of falls; and 3. For facilitating the design and implementation of culturally appropriate, evidence-based interventions that will significantly reduce the number of falls among older persons. The model provides strategies and solutions that will require the engagement of multiple sectors of society. It is dependent on and consistent with the vision articulated in the WHO Active Ageing Policy Framework. Although not all of the awareness, assessment, and intervention strategies identified in the model apply equally well in all regions of the world, there are significant evidence-based strategies that can be effectively implemented in all regions and cultures. The degree to which progress will be made depends on to the success in integrating falls prevention strategies into the overall health and social care agendas globally. In order to do this effectively, it is necessary to identify and implement culturally appropriate, evidence-based policies and procedures. This requires multi-sectoral, collaborations, strong commitment to public and professional education, interaction based on evidence drawn from a variety of traditional, complementary, and alternative sources. Although the understanding of the evidence-base is growing, there is much that is not yet understood. Thus, there is an urgent need for continued research in all areas of falls prevention and treatment in order to better understand the scope of the problem worldwide. In particular, more evidence of the cost-effectiveness of interconnections is needed to develop strategies that are most likely to be effective in specific setting and population sub-groups.

Previous studies have already supported the relevance of improved parasympathetic function to maintain a good health status. Currently, it is well documented that people with high physical activity status present better ANS function, as well as non-smokers subjects. Many factors are related to impaired ANS function, including, sedentary habits, smoking, high fat intake, genetic changes, etc.

access physical therapy armonk: *Nurses on the Move* Mireille Kingma, 2018-07-05 South African nurses care for patients in London, hospitals recruit Filipino nurses to Los Angeles, and Chinese nurses practice their profession in Ireland. In every industrialized country of the world, patients today increasingly find that the nurses who care for them come from a vast array of countries. In the first book on international nurse migration, Mireille Kingma investigates one of today's most important health care trends. The personal stories of migrant nurses that fill this book contrast the nightmarish existences of some with the successes of others. Health systems in industrialized countries now depend on nurses from the developing world to address their nursing shortages. This situation raises a host of thorny questions. What causes nurses to decide to migrate? Is this migration voluntary or in some way coerced? When developing countries are faced with nurse vacancy rates of more than 40 percent, is recruitment by industrialized countries fair play in a competitive market or a new form of colonialization? What happens to these workers—and the patients left behind—when they migrate? What safeguards will protect nurses and the patients they find in their new workplaces? Highlighting the complexity of the international rules and regulations now being constructed to facilitate the lucrative trade in human services, Kingma presents a new way to think about the migration of skilled health-sector labor as well as the strategies needed to make migration work for individuals, patients, and the health systems on which they depend.

access physical therapy armonk: Understanding and Treating Fear of Pain Gordon J. G. Asmundson, Johan Wolfgang Silvain Vlaeyen, Geert Crombez, 2004 People who suffer from chronic pain are typically found to be more anxious and fearful of pain than those who do not. Recent evidence has shown that the fear itself serves as a mechanism through which chronic pain is maintained over time. Even once the muscle or tissue damage is healed, a fear of further pain can lead to avoidance behaviour, which over time, leads to deconditioning (e.g. decreased mobility, weight gain). This in turn leads to further pain experiences, negative expectancies, and strengthened avoidance. It is the reciprocal relationship between fear and avoidance that is thought to be responsible for maintaining pain behaviour and disability. With fear of pain known to cause significant suffering and functional disability, there is a need for a greater understanding of this

condition. This is the first book to explore this topic. It starts by introducing the current theoretical positions regarding pain-related fear and anxiety alongwith relevant empirical findings. It then provides comprehensive coverage of assessment issues and treatment strategies. Finally, the book suggests further areas for investigation. Pain-related fear and anxiety are now receiving considerable attention, and efficient and effective treatments are fast becoming available. This book will help guide and extend our understanding of a condition that has been shown to be associated with substantial suffering and disability.

Prechtl, Arend Bos, Fabrizio Ferrari, Giovanni Cioni, 2008-12-03 A quick, non-invasive, non-intrusive and cost-effective method with high reliability and high validity is much in demand for the early detection of neurological anomalies which point to cerebral palsy and developmental deficits later on in life. Over his years as a distinguished developmental neurologist, Heinz Prechtl has devised such a method; a qualitative assessment of general movements (GMs) as a specific predictor for neurological impairments. His method is described in this book. GMs form part of a distinct pattern of movements in preterm babies, term newborns and young infants. They are complex, frequent, and usually of sufficient length. Changes in the normal quality of GMs are a reliable indicator of brain dysfunction.

Includes a CD-ROM giving 15 cases selected from the book. Each is of about one minute in duration and demonstrates the different age-specific movement patterns.

All chapters are written by world-leading researchers who draw on the findings of human clinical trials to provide uncompromising assessments of individual treatments, including herbal anxiolytics with sedative actions, adaptogens, cognitive anxiolytics, and nutraceuticals. Traditional treatments requiring further study – including the plant-based psychotropic Ayahuasca and other phytotherapies of potential value in the treatment of anxiety – are also reviewed. In the closing chapters, a series of helpful case studies are provided by mental health clinicians in order to illustrate how herbal and nutritional treatments can best be integrated into an overall treatment plan for individuals with a range of comorbid diagnoses. Mental health professionals, researchers, and general readers will find that the book provides an excellent review of current scientific knowledge gained from the study of herbal and nutritional treatments, together with important clinical recommendations for their use in patients experiencing clinically significant levels of anxiety.

Campbell, Margo Orlin, 2014-04-25 Used as both a core textbook in PT programs and as a clinical reference, *Physical Therapy for Children*, 4th Edition, provides the essential information needed by PTs, both student and professional, when working with children. Like the previous bestselling editions, the 4th edition follows the practice pattern categories of the *Guide to Physical Therapist Practice* and uses the IFC model of the disabling process as it presents up-to-date evidence-based coverage of treatment. In this latest edition, Suzann Campbell DeLapp, Robert J. Palisano, and Margo N. Orlin have added more case studies and video clips, additional chapters and Medline-linked references online, and Evidence to Practice boxes to make it easy to find and remember important information. Provides comprehensive foundational knowledge in decision making, screening, development, motor control, and motor learning, the impairments of body function and structure, and the PT management of pediatric disorders. Reflects a family-centered care model throughout to help you understand how to involve children and their caregivers in developing and implementing intervention plans. Emphasizes an evidence-based approach that incorporates the latest research for the best outcomes. Follows the practice pattern guidelines of the *Guide to Physical Therapist Practice*, 2nd Edition which sets the standard for physical therapy practice. Features the International Classification of Function, Disability, and Health (ICF) of the World Health Organization (WHO) as the model for the disabling process, emphasizing activity rather than functional limitations and participation rather than disability in keeping with the book's focus on prevention of disability.
