airport management online course: Competency-Based Education in Aviation Suzanne K. Kearns, Timothy J. Mavin, Steven Hodge, 2017-05-15 Whether a trainee is studying air traffic control, piloting, maintenance engineering, or cabin crew, they must complete a set number of training 'hours' before being licensed or certified. The aviation industry is moving away from an hours-based to a competency-based training system. Within this approach, training is complete when a learner can demonstrate competent performance. Training based on competency is an increasingly popular approach in aviation. It allows for an alternate means of compliance with international regulations - which can result in shorter and more efficient training programs. However there are also challenges with a competency-based approach. The definition of competency-based education can be confusing, training can be reductionist and artificially simplistic, professional interpretation of written competencies can vary between individuals, and this approach can have a high administrative and regulatory burden. Competency-Based Education in Aviation: Exploring Alternate Training Pathways explores this approach to training in great detail, considering the four aviation professional groups of air traffic control, pilots, maintenance engineers, and cabin crew. Aviation training experts were interviewed and have contributed professional insights along with personal stories and anecdotes associated with competency-based approaches in their fields. Research-based

and practical strategies for the effective creation, delivery, and assessment of competency-based education are described in detail.

airport management online course: *Aviation Law and Regulation* Lucy Budd, Stephen Ison, 2019-10-21 The development of civil aviation in the early 20th century presented a range of new legal and regulatory challenges concerning the rights of an aircraft from one state to enter the aerial territory of another. International flights threatened the territorial integrity of nation states and prompted politicians to draw up new aerial legislation and regulations to govern this new form of aerial movement. Whereas some states advocated free and open access to airspace and unrestricted aerial movement, other nations pursued a more protectionist stance based on regulation and reciprocal access arrangements. Technological developments in aircraft design and performance, combined with changing global political relations and the introduction of new forms of economic regulation have all fundamentally affected the development of air transport. This Volume explores carefully selected aspects of aviation law and regulation and examines the implications of changing regulatory intervention on the form and function of civil aviation worldwide.
